

Exploration Surface Well Testing Services

Using the MPFM in exploration surface well testing can realize the benefits of real time monitoring and real time display of the test process, which can comprehensively reflect the dynamic process of the well from initial flow to flowing on different choke sizes and provide primary data for reservoir evaluation during the exploration stage.

To use the MPFM for exploration well testing instead of a conventional test separator represents the development direction of exploration technology and there are many benefits to it; greatly simplifying exploration well testing equipment and processes, substantially saving CAPEX and OPEX, reducing the time of field construction, as well as improving reservoir appraisal and management.
